Weekly Assignment 5

Leong Kai Ler 15334636 March 5, 2019

Question 1

A box contains 5 red and 5 blue marbles. Two marbles are withdrawn randomly. If they are the same color, then you win \$1.10; if they are different colors, then you lose \$1.00. Calculate:

Problem Part a:

The expected value of the amount you win.

Solution Part a:

There are two possibilities that satisfy the event, either we draw two red marbles or two blue ones. Let say we want to draw two red marbles, there are $\frac{5}{10}$ chance to get a red marble in first draw and $\frac{4}{9}$ of getting a second one. Same calculations apply for the getting two blue marbles. Hence, probability of getting two marbles of same color is $\frac{5}{10} * \frac{4}{9} * 2 = \frac{4}{9}$.

$$E[X] = P(E) * 1.1 + (1 - P(E)) * (-1.0)$$

$$= \frac{4}{9} * 1.1 + \frac{5}{9} * (-1.0)$$

$$= -\frac{1}{15}$$

$$\approx -0.0667$$

Problem Part b:

The variance of the amount you win.

Solution Part b:

$$E[X^{2}] = \frac{4}{9} * 1.1^{2} + \frac{5}{9} * (-1.0)^{2}$$

$$= \frac{82}{75}$$

$$Var[X] = E[X^{2}] - (E[X])^{2}$$

$$= \frac{82}{75} - (-\frac{1}{15})^{2}$$

$$= \frac{49}{45}$$

$$\approx 1.08889$$

Question 2

Suppose you carry out a poll following an election. You do this by selecting n people uniformly at random and asking whether they voted or not, letting Xi = 1 if person i voted and Xi = 0 otherwise. Suppose the probability that a person voted is 0.6.

Problem Part a:

Calculate $E[X_i]$ and $Var(X_i)$.

Solution Part a:

$$E[X_i] = 0.6 * 1 + 0.4 * 0$$

$$= 0.6$$

$$E[(X_i)^2] = 0.6 * 1^2 + 0.4 * 0$$

$$= 0.6$$

$$Var[X_i] = E[(X_i)^2] - E[X_i]^2$$

$$= 0.6 - 0.6^2$$

$$= 0.24$$

or Using Bernoulli random variable method:

$$E[X_i] = p$$
= 0.6
$$Var[X_i] = p * (1 - p)$$
= 0.6 * (1 - 0.6)
= 0.6 * 0.4
= 0.24

Problem Part b:

Let $Y = \sum_{i=1}^{n} X_i$. What is E[Y]? Is it the same as E[X] or different, and why?

Solution Part b:

$$E[Y] = E[\sum_{i=1}^{n} X_i]$$
$$= \sum_{i=1}^{n} E[X_i]$$
$$= n * E[X_i]$$
$$= n * 0.6$$

Since $E[Y] \neq E[X_i]$, i.e. E[Y] is the sum of $E[X_i]$ by n times, E[Y] is different compared to $E[X_i]$.

Problem Part c:

What is $E[\frac{1}{n}Y]$?

Solution Part c:

Using linearity o expectation:

$$E\left[\frac{1}{n}Y\right] = E\left[\frac{1}{n}\sum_{i=1}^{n}X_{i}\right]$$

$$= \frac{1}{n}\sum_{i=1}^{n}E[X_{i}]$$

$$= \frac{1}{n}*n*E[X_{i}]$$

$$= 0.6$$

$$= E[X_{i}]$$

Hence, $E[\frac{1}{n}Y]$ can be simplified into $E[X_i]$.

Problem Part d:

What is the variance of $\frac{1}{n}Y$ (express in terms of Var(X))? Hints: use linearity of the expectation and the fact that people are sampled independently.

Solution Part d:

$$Var[Y] = n * Var[X]$$

$$= n * 0.24$$

$$Var[\frac{1}{n}Y] = \frac{1}{n}Var[X]$$

$$= \frac{1}{n} * n * Var[X]$$

$$= Var[X]$$

Question 3

Suppose that 2 balls are chosen without replacement from an urn consisting of 5 white and 8 red balls. Let X_i equal 1 if the i^{th} ball selected is white, and let it equal 0 otherwise.

Problem Part a:

Give the joint probability mass function of X_1 and X_2

Solution Part a:

To calculate joint probability mass function of X_1 and X_2 , we need to compute their distributions.

$$P(X_1 = 0, X_2 = 0) = \frac{8}{13} * \frac{7}{12}$$
$$= \frac{14}{39}$$

$$P(X_1 = 1, X_2 = 0) = \frac{5}{13} * \frac{8}{12}$$
$$= \frac{10}{39}$$

$$P(X_1 = 0, X_2 = 1) = \frac{8}{13} * \frac{5}{12}$$
$$= \frac{10}{39}$$

$$P(X_1 = 1, X_2 = 1) = \frac{5}{13} * \frac{4}{12}$$
$$= \frac{5}{39}$$

Hence, the tabular form of joint pmf would look as illustrated below:

	$X_1 = 0$	$X_1 = 1$	$P(X_1 = x_1)$
$X_2 = 0$	$\frac{14}{39}$	$\frac{10}{39}$	$\frac{24}{39}$
$X_2 = 1$	10 39	$\frac{5}{39}$	$\frac{15}{39}$
$P(X_2 = x_2)$	$\frac{24}{39}$	$\frac{15}{39}$	1

Problem Part b:

Are X_1 and X_2 independent? (Use the formal definition of independence to determine this)

Solution Part b:

For X_1 and X_2 to be independent, we need to prove:

$$P(X_1 = x_1 \cap X_2 = x_2) = P(X_1 = x_1) * P(X_2 = x_2)$$

for all $x_1 \in R_{X_1}$ and $x_2 \in R_{X_2}$.

Take an example of $P(X_2 = 1)$ and $P(X_2 = 1 | X_1 = 1)$:

$$P(X_2 = 1) = \frac{15}{39}$$

$$P(X_2 = 1 | X_1 = 0) = \frac{P(X_1 = 0 | X_2 = 1)}{P(X_1 = 0)}$$

$$= \frac{\frac{10}{39}}{\frac{24}{39}}$$

$$= \frac{5}{12}$$

Since $P(X_2 = 1) \neq P(X_2 = 1 | X_1 = 0)$, X_1 and X_2 are not independent.

Problem Part c:

Calculate $E[X_2]$

Solution Part c:

$$E[X_2] = P(X_2 = x_2)$$

$$= \frac{15}{39} * 1 + \frac{24}{39} * 0$$

$$= \frac{5}{13}$$

$$\approx 0.3846$$

Problem Part d:

Calculate $E[X_2|X1=1]$

Solution Part d:

$$E[X_2|X1 = 1] = \frac{P(X_2 = x_2)}{P(X_1 = 1)}$$

$$= \frac{\frac{5}{39} * 1 + \frac{10}{39} * 0}{\frac{15}{39}}$$

$$= \frac{1}{3}$$

$$\approx 0.3333$$
